

U.S. Environmental Data Summary

The environmental survey program provides data on agricultural chemical and fertilizer usage, pest management practices, and postharvest chemical applications. Agricultural chemical use data are released for selected major field crops, fruits and nuts, vegetables, and livestock and their facilities. Postharvest chemical use data are released for selected crops in storage, such as apples, potatoes, corn, wheat, rice, and peanuts. Pest management practices data are released to show what farmers are doing to reduce their dependency on agricultural chemicals. Pests are defined as weeds, insects, and diseases. Pest management practices were categorized into four areas: prevention, avoidance, monitoring, and suppression.

Following is a list of environmental products released during the past year:

Agricultural Chemical Usage - Postharvest Applications are released in March. For the March 2001 release, peanuts, rice, and sorghum were targeted. The March 2002 release targeted wheat.

Agricultural Chemical Usage 2000 Sheep and Sheep Facilities was released May 2001.

Agricultural Chemical Usage 2000 Field Crops Summary was released May 2001. The agricultural chemical use estimates refer to on-farm use of commercial fertilizers and pesticides on targeted crops for selected States. The targeted crops were: corn, upland cotton, rice, soybeans, sugarbeets, and wheat.

Agricultural Chemical Usage 2000 Vegetables Summary was released July 2001. This report includes farm use of 2000 crop year pesticides for 43 vegetable crops in 19 major producing States.

Agricultural Chemical Usage 2000 Restricted Use Summary was released October 2001. The chemical data provided in this report is limited to restricted use pesticides. This class of pesticides has been determined by the U.S. Environmental Protection Agency (EPA) to be "restricted", that is they are available for purchase and use only by certified pesticide applicators or persons under their direct supervision.
